

STYLEGPT × SAVANA

The next leap in **fashion commerce** isn't more products — it's **better decisions**

Presented by Meghana Yerrapragada

Savana's users don't lack options. They lack a system that tells them what to buy, how to style it, and why it works — together.

Made with **GAMMA**

Three Failures. **One Systemic Gap.**

01 — Decision Fatigue

Shoppers browse 40+ products per session but convert on fewer than 2. Without styling guidance, choice becomes paralysis.

02 — High Return Rates

Industry-wide, 28–35% of fashion orders are returned (Source: Statista / KPMG Retail Report). The primary driver: shoppers cannot visualize how individual pieces work as a complete outfit.

03 — Low Average Order Value

Most sessions result in single-item purchases. Accessories and complementary pieces are browsed separately — or not at all.

40–60%

Conversion Drop

Without styling context

Revenue Lost

To returns in logistics and restocking

❏ Core Hypothesis: Savana's users don't lack the will to dress well — they lack a system that removes the effort. StyleGPT is that system.

Three Users. **One Unmet Need.**

The Casual Shopper — 55%

Age 22–30. Student or early-career · Impulse and occasion driven Opens Savana when she needs something — a party, a date, a trip. Spends 30+ minutes scrolling, adds 3 items to her wishlist, buys nothing. The problem isn't the catalog — it's that nothing feels like a complete, ready answer.

Pain: She knows her occasion. She doesn't know her outfit.

The Style Optimizer — 30%

Age 28–38 Professional · Higher spend · 2–4 items per session Opens Savana with taste and intent. Spends 45+ minutes across tabs, wishlists, and screenshots trying to build one complete look manually. The intelligence exists in her head — StyleGPT just needs to put it on screen. **Pain:** She knows her style. She shouldn't have to do the work herself.

The Occasion Buyer — 15%

All ages · Event-driven · Wedding, festival, date, office Opens Savana with one specific need and a deadline. Buys the dress, forgets the bag, returns the shoes. Every occasion purchase is three separate decisions that should have been one. **Pain:** She knows her event. She needs a complete outfit — not individual products.

Old tools show you products. StyleGPT shows you possibilities

Why Traditional Approaches Fail

- **Rule-Based Systems** — Static filters. Cannot reason across occasion, budget, and personal style simultaneously.
- **Traditional Recommendation ML** — Predicts patterns but cannot explain decisions or generate complete outfits.
- **Search + Filter UI** — Puts the entire cognitive burden on the user.

Why GenAI Is the Right Solution

- **Understands Intent** — Interprets occasion, budget, and styling brief in one prompt.
- **Explains Every Decision** — Surfaces color harmony, occasion fit, and budget optimization.
- **Iterates in Conversation** — Unlimited refinement through natural language. No restarts.
- **Creates a Daily Engagement Loop** — A styled recommendation is a reason to return.

Capability	Rule-Based	Traditional ML	GenAI (StyleGPT)
Understand occasion & intent			✓
Generate complete outfit looks			✓
Explain why each item was chosen			✓
Swap / remove via natural language			✓
Budget-aware, occasion-aware styling			✓

Why Now: Multimodal LLM infrastructure is production-ready. Inference costs have dropped significantly. The window to build a defensible AI styling layer is open — and closing fast.

THE SOLUTION

StyleGPT — India's First AI Fashion Decision Engine

Built natively into Savana. Powered by everything Savana already knows about its users. Understands. Reasons. Personalizes. Delivers.

AI Chat Stylist

Describe occasion, mood, budget — receive a complete outfit in seconds.

Wardrobe AI

Upload a piece you own. StyleGPT builds a complete outfit around it.

Bundle Commerce

Add an entire AI-curated outfit to cart in one tap. Bundle pricing applied automatically.

Try-On Studio

Preview outfits on a customizable mannequin or upload your own photo.

Mix & Match

AI styling verdict — what works, what clashes, and why. Flat-lay preview included.

Fashion Memory

Learns preferences over time. Every session is smarter than the last.

StyleGPT doesn't sell products. It sells the confidence that comes from knowing your outfit is right.

StyleGPT — App Screens

Place your UI screenshots below. Each screen represents a stage in the intelligent styling loop.

Screen A — Home + Entry

Occasion cards, prompt input bar, suggested prompt chips, "Styled for You" look cards.

Screen B — AI Chat page

Budget slider, AI typing state, look generation animation, look counter (01 of 03).

Screen C — AI Curated Look Page

Mannequin with outfit layered, product cards with Swap / Remove / Why this? micro-prompts, Add Entire Look CTA.

Screen D — customize or microprompt page

Upload area, AI analysis card, suggested matching items from catalog, micro-prompt chips.

Screen E — Wardrobe AI page

Upload area + AI analysis card + suggested matching items from catalog.

Screen F — Fashion Memory / Lookbook

Style profile, StyleGPT recommendation card, saved looks organized by occasion and season.

From Intent to Outfit Purchase — One Intelligent Loop

StyleGPT is not a search tool with a chat interface. It is a reasoning system that understands goals, evaluates catalog options, and delivers a complete, personalized, purchasable answer. Every interaction produces a decision — not a list.

BUSINESS IMPACT

Numbers That Move Savana's Business

Two goals. Zero vanity metrics. Every number connects to a revenue or cost line. All figures are **Projections** based on AI-assisted styling benchmarks.

+34%

Conversion Rate

AI-curated looks vs standard browse sessions

+58%

Average Order Value

Bundle sessions vs non-StyleGPT sessions

+22%

D30 Retention

StyleGPT users vs control cohort

-41%

Return Rate

AI-styled purchases vs manually browsed

-68%

Decision Time

From session open to cart add

Measurement Timeline

- **Months 1–3 · Signal** — Chat open rate, first AI add-to-cart, look save rate
- **Months 3–6 · Validate** — AOV delta, D30 retention, return rate, Mix & Match engagement
- **Months 6–12 · Impact** — Revenue per session, return cost reduction, Fashion Memory accuracy

Secondary Metrics

- Look save rate — proxy for intent and engagement quality
- Swap / Remove interactions — measures AI customization depth
- "Why this?" tap rate — measures trust and explainability
- Wardrobe upload rate — measures feature adoption beyond chat

We've Thought About **What Goes Wrong**

 Privacy note: All photos uploaded for personal try-on are processed on-device. No image is stored on Savana's servers beyond the active session. An explicit privacy notice appears at the point of upload — not buried in settings.

Risk	Severity	Solution
AI Hallucinations	Critical	Closed-catalog RAG — retrieves before it reasons
User Privacy	Critical	On-device photo processing, session-only data
Response Latency	High	Pre-computation + streaming under 500ms
User Trust	High	Explainability via "Why this?" + coach positioning
Scalability	Medium	3-tier architecture + intelligent model routing
Adoption Barriers	Medium	Progressive disclosure + first-session wow moment

STYLEGPT × SAVANA

Fashion Shoppers Don't Buy Products. **They Buy Confidence.**

StyleGPT sells confidence. Built natively into Savana. Powered by GenAI. Ready to transform how India shops for fashion.

Try the Prototype

style-savana-spark.lovable.app

What to Explore

Ask for a "College Farewell outfit under ₹4,000." Upload a wardrobe piece. Try Mix & Match. Customize the mannequin.
